BRIEF REPORT

Abnormal coagulation parameters are associated with poor prognosis in patients with novel coronavirus pneumonia

Ning Tang[1] | Dengju Li[2] | Xiong Wang[1] | Ziyong Sun[1]

J Thromb Haemost. 2020;18:844-847

- Tongji Hospital of Huazhong University of Science and Technology
- **2020年1月1日～2月3日**までCOVID-19で入院した**183症例**
- PT、APTT、AT、フィブリノゲン、FDP、Dダイマーを測定し、**生存者と死亡者で比較**

- 85人の女性＋98人の男性＝**183**症例
- 平均年齢**54.1**歳（19.4-94歳）
- 75症例（41%）が慢性疾患（心疾患、脳血管疾患、呼吸器疾患、腫瘍、慢性肝疾患、慢性腎臓病など）
- 2月13日時点

  退院：78症例（42.6%）、死亡：21症例（11.5%）、入院継続84症例（45.9%）

TABLE 1 Coagulation parameters of NCP patients on admission

生存者　　非生存者

Parameters	Normal range	Total (n = 183)	Survivors (n = 162)	Non-survivors (n = 21)	*P* values
Age (years)		54.1 ± 16.2	52.4 ± 15.6	64.0 ± 20.7	<.001
Sex (male/female)		98/85	82/80	16/5	.035
With underlying diseases		75 (41.0%)	63 (38.9%)	12 (57.1%)	.156
On admission					
PT (sec)	11.5-14.5	13.7 (13.1-14.6)	13.6 (13.0-14.3)	15.5 (14.4-16.3)	<.001
APTT (sec)	29.0-42.0	41.6 (36.9-44.5)	41.2 (36.9-44.0)	44.8 (40.2-51.0)	.096
Fibrinogen (g/L)	2.0-4.0	4.55 (3.66-5.17)	4.51 (3.65-5.09)	5.16 (3.74-5.69)	.149
D-dimer (μg/mL)	<0.50	0.66 (0.38-1.50)	0.61 (0.35-1.29)	2.12 (0.77-5.27)	<.001
FDP (μg/mL)	<5.0	4.0 (4.0-4.9)	4.0 (4.0-4.3)	7.6 (4.0-23.4)	<.001
AT (%)	80-120	91 (83-97)	91 (84-97)	84 (78-90)	.096

Abbreviations: APTT, activated partial thromboplastin time; AT, antithrombin activity; FDP, fibrin degradation product; NCP, novel coronavirus pneumonia; PT, prothrombin time (PT).

1099症例　552の病院@中国

- **Primary Composite End point**
  →ICU入室と人工呼吸器使用もしくは死亡
- **重症度**

年齢の中央値は**47**歳

Primary composite end point：**67**症例（6.1%）

ICU入室：　5%
人工呼吸器：　2.3%
死亡：　1.4%

症状、画像所見、血液検査などについて報告

Table 1. Clinical Characteristics of the Study Patients, According to Disease Severity and the Presence or Absence of the Primary Composite End Point.*

Characteristic	All Patients (N=1099)	Disease Severity		Presence of Primary Composite End Point†	
		Nonsevere (N=926)	Severe (N=173)	Yes (N=67)	No (N=1032)
Age					
Median (IQR) — yr	47.0 (35.0–58.0)	45.0 (34.0–57.0)	52.0 (40.0–65.0)	63.0 (53.0–71.0)	46.0 (35.0–57.0)
Distribution — no./total no. (%)					
0–14 yr	9/1011 (0.9)	8/848 (0.9)	1/163 (0.6)	0	9/946 (1.0)
15–49 yr	557/1011 (55.1)	490/848 (57.8)	67/163 (41.1)	12/65 (18.5)	545/946 (57.6)
50–64 yr	292/1011 (28.9)	241/848 (28.4)	51/163 (31.3)	21/65 (32.3)	271/946 (28.6)
≥65 yr	153/1011 (15.1)	109/848 (12.9)	44/163 (27.0)	32/65 (49.2)	121/946 (12.8)
Female sex — no./total no. (%)	459/1096 (41.9)	386/923 (41.8)	73/173 (42.2)	22/67 (32.8)	437/1029 (42.5)
Smoking history — no./total no. (%)					
Never smoked	927/1085 (85.4)	793/913 (86.9)	134/172 (77.9)	44/66 (66.7)	883/1019 (86.7)
Former smoker	21/1085 (1.9)	12/913 (1.3)	9/172 (5.2)	5/66 (7.6)	16/1019 (1.6)
Current smoker	137/1085 (12.6)	108/913 (11.8)	29/172 (16.9)	17/66 (25.8)	120/1019 (11.8)
Exposure to source of transmission within past 14 days — no./total no.					
Living in Wuhan	483/1099 (43.9)	400/926 (43.2)	83/173 (48.0)	39/67 (58.2)	444/1032 (43.0)
Contact with wildlife	13/687 (1.9)	10/559 (1.8)	3/128 (2.3)	1/41 (2.4)	12/646 (1.9)
Recently visited Wuhan‡	193/616 (31.3)	166/526 (31.6)	27/90 (30.0)	10/28 (35.7)	183/588 (31.1)
Had contact with Wuhan residents‡	442/611 (72.3)	376/522 (72.0)	66/89 (74.2)	19/28 (67.9)	423/583 (72.6)
Median incubation period (IQR) — days§	4.0 (2.0–7.0)	4.0 (2.8–7.0)	4.0 (2.0–7.0)	4.0 (1.0–7.5)	4.0 (2.0–7.0)
Fever on admission					
Patients — no./total no. (%)	473/1081 (43.8)	391/910 (43.0)	82/171 (48.0)	24/66 (36.4)	449/1015 (44.2)
Median temperature (IQR) — °C	37.3 (36.7–38.0)	37.3 (36.7–38.0)	37.4 (36.7–38.1)	36.8 (36.3–37.8)	37.3 (36.7–38.0)
Distribution of temperature — no./total no. (%)					
<37.5°C	608/1081 (56.2)	519/910 (57.0)	89/171 (52.0)	42/66 (63.6)	566/1015 (55.8)
37.5–38.0°C	238/1081 (22.0)	201/910 (22.1)	37/171 (21.6)	10/66 (15.2)	228/1015 (22.5)
38.1–39.0°C	197/1081 (18.2)	160/910 (17.6)	37/171 (21.6)	11/66 (16.7)	186/1015 (18.3)
>39.0°C	38/1081 (3.5)	30/910 (3.3)	8/171 (4.7)	3/66 (4.5)	35/1015 (3.4)
Fever during hospitalization					
Patients — no./total no. (%)	975/1099 (88.7)	816/926 (88.1)	159/173 (91.9)	59/67 (88.1)	916/1032 (88.8)
Median highest temperature (IQR) — °C	38.3 (37.8–38.9)	38.3 (37.8–38.9)	38.5 (38.0–39.0)	38.5 (38.0–39.0)	38.3 (37.8–38.9)
<37.5°C	92/926 (9.9)	79/774 (10.2)	13/152 (8.6)	3/54 (5.6)	89/872 (10.2)

Abbreviations: α-HBDH, α-hydroxybutyric dehydrogenase; ARDS, acute respiratory distress syndrome; ALT, alanine aminotransferase; APTT, activated partial thromboplastin time; AST, aspartate aminotransferase; CK-MB, creatine kinase muscle-brain isoform; ECMO, extracorporeal membrane oxygenation; ESR, erythrocyte sedimentation rate; hs-CRP, high-sensitivity C-reactive protein; IL-6, interleukin-6; IMV, invasive mechanical ventilation; IQR, interquartile range; NMV, noninvasive mechanical ventilation (including high flow supply and face mask); LDH, lactate dehydrogenase; LDL, low-density lipoprotein; PT, prothrombin time.

[a] Difference in location for continuous variables (by Hodges-Lehmann method) and in percentage for categorical variables (With ARDS vs Without ARDS or Died vs Alive).

[b] Mann-Whitney-Wilcoxon was used for continuous variables, and χ^2 test was used for categorical variables, if not specified.

[c] Fisher exact test.

IL-6とDダイマーは

ARDSに進展した患者で高く、その中では死亡者も多い

Table 4. Bivariate Cox Regression of Factors Associated With ARDS Development or Progression From ARDS to Death

Patient characteristics and findings	ARDS		Death	
	HR (95% CI)	*P* value	HR (95% CI)	*P* value
Clinical characteristics				
Age (≥65 vs <65), y	3.26 (2.08-5.11)	<.001	6.17 (3.26-11.67)	<.001
Gender (male vs female)	1.47 (0.92-2.36)	.11	0.56 (0.30-1.05)	.07
Highest patient temperature (≥39 °C vs <39 °C)	1.77 (1.11-2.84)	.02	0.41 (0.21-0.82)	.01
Comorbidities				
Hypertension (yes vs no)	1.82 (1.13-2.95)	.01	1.70 (0.92-3.14)	.09

PMID: 32367170

High risk of thrombosis in patients with severe SARS-CoV-2 infection: a multicenter prospective cohort study

組入基準：

- 2020年3月3日～31日
- フランスの3次病院で2つの病院、4つのICU
- **SARS-CoV-2陽性**で**ARDS**の患者と**Non-Covid-19**のARDS

除外基準：なし

4月7日にデータ解析(最短の症例で7日間のフォローアップ)

- ICUにいる間は毎日血小板と凝固の検査
- PT、AT活性、フィブリノーゲン、Dダイマー、APTT
- 第5因子(Factor V：FV)、von Willebrand factor(vWF)抗原、vWF活性、第8因子(FactorVIII：FVIII)
- ループスアンチコアグラントは凝固異常が疑われたときに調べた
- →APTT延長や血栓症のイベントがおきたとき

Primary Outcome

すべての血栓症イベント

深部静脈血栓症、肺塞栓、心筋梗塞、腸管虚血、下肢虚血、脳梗塞

Secondary Outcome

血栓症の発生率、RRT フィルターの凝固の発生率、出血の合併症
RRT回路のLifespanの中央値、ECMO回路の凝固、凝固検査の結果

Results

Baseline characteristics

データ解析時は100人は挿管中

ICU滞在9.6±4.2日

死亡率8.7%

36人はICU退室

ロピナビル＋リトナビル
84症例（60%）

レムデシビル
8症例（5.3%）

ヒドロクロロキン

Table 2 Coagulation parameters of COVID-19 patients

	All patients ($n = 150$)
Baseline coagulation parameters	
Platelet count (10^9/L)—normal range: 150–400.10^9/L	200 [152; 267]
aPTT—normal range: 0.7–1.2	1.2 [1.1; 1.3]
PT (%)—normal range: > 70%	84 [73; 91]
INR—normal range: 1.00–1.15	1.12 [1.05; 1.25]
D-dimers (mg/L)—normal range: < 0.5 mg/L	2.27 [1.16; 20]
Fibrinogen (g/L)—normal range: 2–4 g/L	6.99 [6.08; 7.73]
Antithrombin activity (%)—normal range: 50–150%	91 [78; 102]
Factor V (%)—normal range: > 70%	136 [115; 150]
Factor VIII (%)—normal range: 60–150%	341 [258; 416]
vWF activity (%)	328 [212; 342]
vWF antigen (%)—normal range: 50–150%	455 [350; 521]
Lupus anticoagulant[a]—*n* (%)	50/57 (87.7)
Screen patient (s)	68.6 [59.5; 85.4]
Screen ratio—normal range: < 1.2	1.63 [1.43; 2.04]
Confirm patient (s)	43.9 [40.9; 48.4]
Confirm ratio—normal range: < 1.2	1.25 [1.13; 1.46]
Screen/confirm ratio—normal range: < 1.2	1.4 [1.25; 1.48]

All results are given in median [IQR], except if specified otherwise

aPTT, activated partial thromboplastin time; INR, international normalized ratio; PT, prothrombin time; vWF, von Willebrand factor

[a] Measured during ICU stay

Discussion

- このprospective cohortの結果、**高い確率で血栓症が起きる**のが結論
- 特にICUに低酸素で入るCOVID19で**肺塞栓が16.7%**も起きた。
- これは**予防的/治療的な抗凝固をしていても起こった**

Composite outcome：**急性肺塞栓、深部静脈血栓症、虚血性脳卒中、心筋梗塞、動脈塞栓**

累積composite outcome発生率**31**%：VTE27%、動脈塞栓3.7%、**肺塞栓が最も多く25症例**で起きた。

Table 3
Description of thrombotic complications.

Type of event	Number of cases	Relevant details
Pulmonary embolism 肺塞栓	25	– 18 cases with at least PE in segmental arteries, 7 cases PE limited to subsegmental arteries
Other venous thromboembolic events	3	– 1 proximal deep-vein thrombosis of the leg – 2 catheter related upper extremity thrombosis
Arterial thrombotic events	3	– All ischemic strokes

Note: acute pulmonary embolism was diagnosed with CT-pulmonary angiography, deep vein thrombosis/upper extremity vein thrombosis was diagnosed with ultrasonography, strokes were diagnosed with CT.

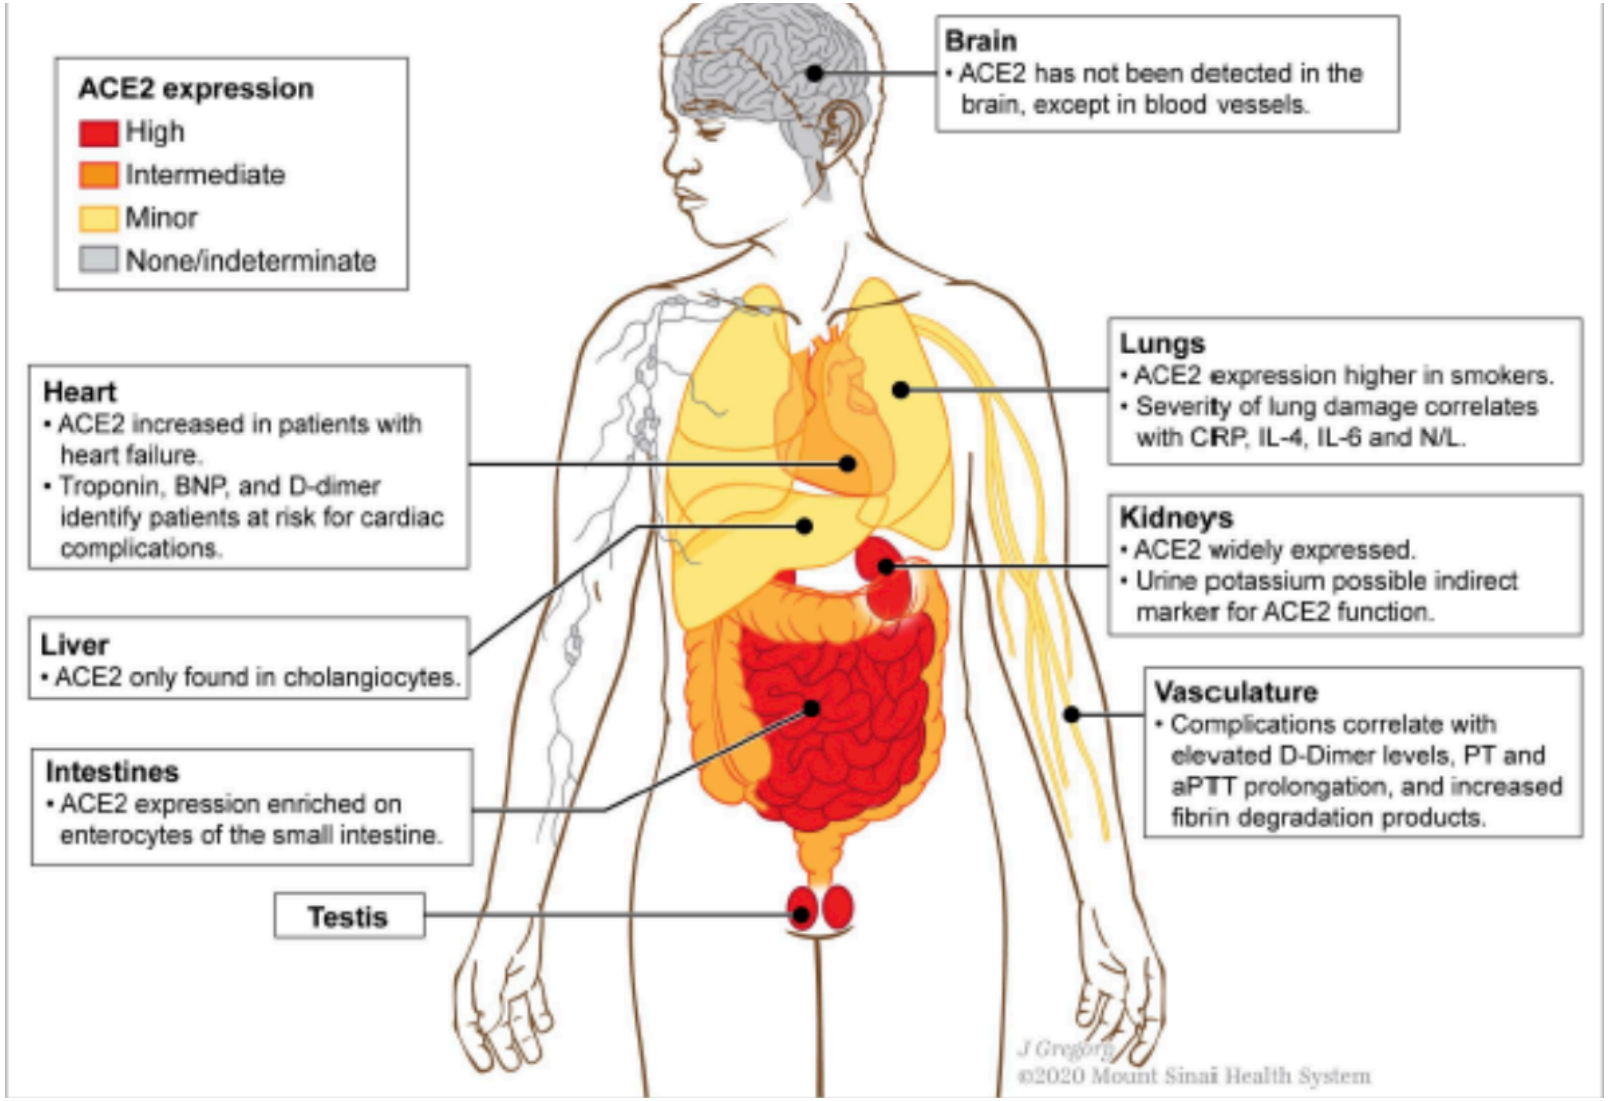
DOI: 10.1056/NEJMcibr2007042



ACE2 expression
High
Intermediate
Minor
None/indeterminate
Brain
• ACE2 has not been detected in the brain, except in blood vessels.
Lungs
• ACE2 expression higher in smokers.
• Severity of lung damage correlates with CRP, IL-4, IL-6 and N/L.
Heart
• ACE2 increased in patients with heart failure.
• Troponin, BNP, and D-dimer identify patients at risk for cardiac complications.
Kidneys
• ACE2 widely expressed.
• Urine potassium possible indirect marker for ACE2 function.
Liver
• ACE2 only found in cholangiocytes.
Vasculature
• Complications correlate with elevated D-Dimer levels, PT and aPTT prolongation, and increased fibrin degradation products.
Intestines
• ACE2 expression enriched on enterocytes of the small intestine.

Figure 2. Microthrombi in the Interalveolar Septa of a Lung from a Patient Who Died from Covid-19.

The interalveolar septum of this patient (Patient 4 in Table S1A in the Supplementary Appendix) shows slightly expanded alveolar walls with multiple fibrinous microthrombi (arrowheads) in the alveolar capillaries. Extravasated erythrocytes and a loose network of fibrin can be seen in the intraalveolar space (hematoxylin–eosin staining; the scale bar corresponds to 50 μm).

Panel: Immune factors contributing to pulmonary intravascular coagulopathy

- Diffuse alveolar damage and inflammation
- Diffuse interstitial inflammation
- Extensive pulmonary macrophage activation (MAS-like)
- Dysregulation of pulmonary innate immune responses (eg, ACE2 receptor expression downregulation)
- Adaptive immune responses to COVID-19
- Activation of innate immunity with older age
- Age-related coagulation cascade changes
- Mechanical ventilation forcing viral immunostimulatory molecules into microvasculature, increasing the propensity towards immunothrombosis

MAS=macrophage activation syndrome. ACE2=angiotensin-converting enzyme 2. COVID-19=coronavirus disease 2019.

Panel：

- びまん性肺胞損傷と炎症
- びまん性間質性炎症
- 広範囲肺マクロファージ活性化（MAS様）
- 肺の自然免疫反応の調節障害
- (例：ACE2受容体の発現ダウンレギュレーション)
- COVID-19に対する適応免疫応答
- 加齢に伴う自然免疫の活性化
- 加齢による凝固カスケードの変化
- ウイルス性免疫刺激分子を微小血管内に強制的に送り込む機械的換気により、免疫血栓症の傾向が強まる。

COVID-19 における抗凝固療法に関して

国際血栓止血学会 DIC 標準化委員会委員長 射場敏明
Chairman/DIC SSC of the International Society on Thrombosis and Haemostasis

COVID-19 では凝固異常や血栓症の合併頻度が高いことが認知され、そのリスクは重症にしたがって増加することが知られています[1]。また凝固異常の合併や血栓症の発症はそれ自体が突然死の原因となったり、病態の増悪因子となったりすることから注意が喚起されてきました。そして国際的なガイダンスにおいても積極的な抗凝固療法の実施が推奨されています[2]。しかしその臨床的な有用性ついては、これまで少数例における検討での効果が報告されているのみでした[3]。今回米国における比較的大規模のコホート研究結果が報告されたのでここで紹介しておきます。

https://www.sciencedirect.com/science/article/abs/pii/S0735109720352189?via%3Dihub

Paranjpe らは[4]、Mt. Sinai 病院に入院した 2,773 例の COVID-19 症例において何らかの抗凝固療法が実施されていた実施例(28%)と非実施例の間で院内死亡と生存期間の比較を行いました。その結果、実施例における死亡率と生存日数の中央値はそれぞれ 22.5%, 21 日であったのに対し、非実施例では 22.8%, 14 日という結果でした。検討症例の重症度については抗凝固治療実施例で重症例が多い傾向があり、侵襲的呼吸補助の実施率は実施例で 29.8%、非実施例では 8.1% (P< 0.01)でした。そして人工換気を実施した 395 例における検討では、実施例の死亡率と生存日数は 29.1%と 21 日、一方非実施例においてはそれぞれ 62.7%と 9 日という結果でした。出血性の有害事象に関しては前者で 3%、後者で 1.9% (P= 0.2)と差は認められませんでした。以上、とくに人工換気を要する重症例では抗凝固療法が転帰の改善をもたらすことが示唆されました。

有効性に関しては引き続き無作為比較試験で確認する必要がありますが、COVID-19 の重症化には凝固異常や血栓形成が関わっていることが予想され、積極的な介入を考慮する必要があると考えます。

診療の手引き 第2版

6．血栓症対策

・重症感染症および呼吸不全は，深部静脈血栓症の中等度リスク因子である．

・さらに，COVID-19 患者においては，サイトカインストームや血管内皮障害などにより線溶亢進および線溶抑制が合併していると推定される．

・D ダイマーが正常上限を超えるような場合には，ヘパリンなどの抗凝固療法を実施することが推奨される．

ISTH interim guidance on recognition and management of coagulopathy in COVID-19

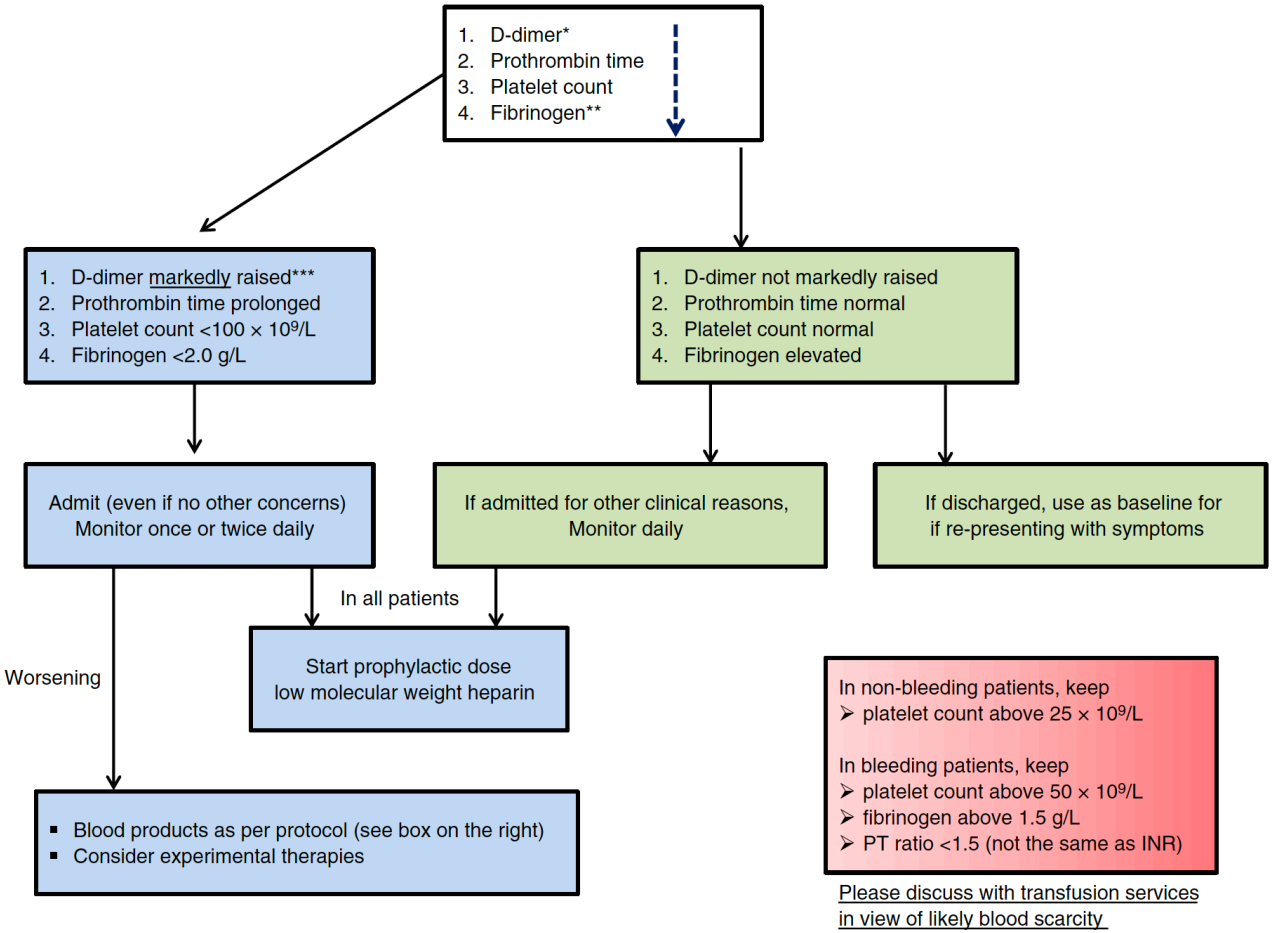

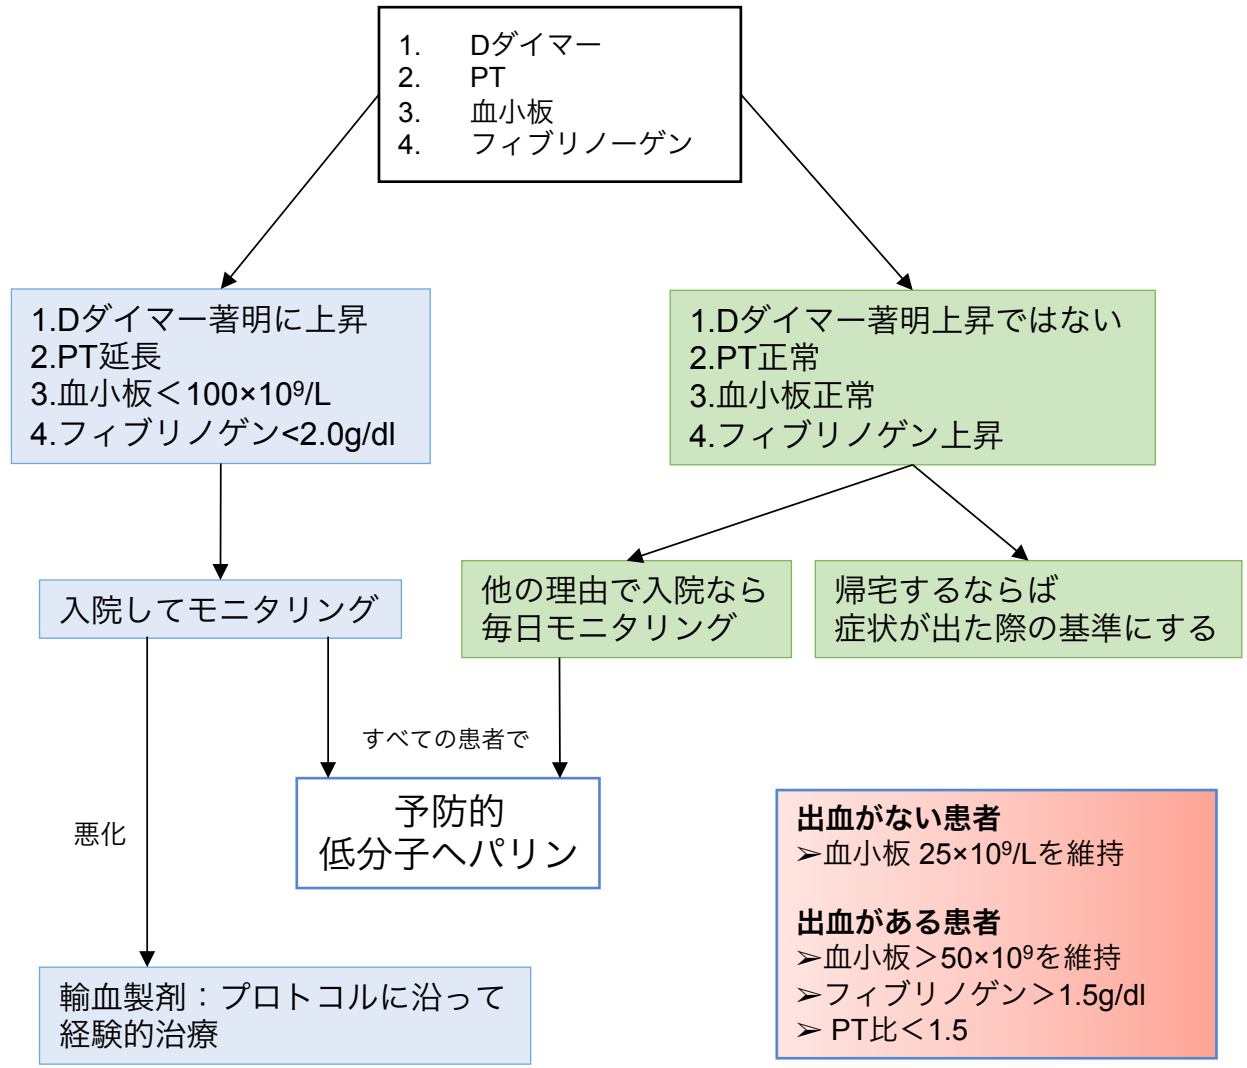

FIGURE 1 Algorithm for the management of coagulopathy in COVID-19 based on simple laboratory markers. * The list of markers is given in decreasing order of importance. ** Performing fibrinogen assays may not be feasible in many laboratories but monitoring the levels can be helpful after patient admission. *** Although a specific cut-off cannot be defined, a three- to four-fold increase in D-dimer values may be considered significant. Any one of the values in this table may be considered significant

ESC European Society of Cardiology
European Heart Journal - Cardiovascular Pharmacotherapy
doi:10.1093/ehjcvp/pvaa036

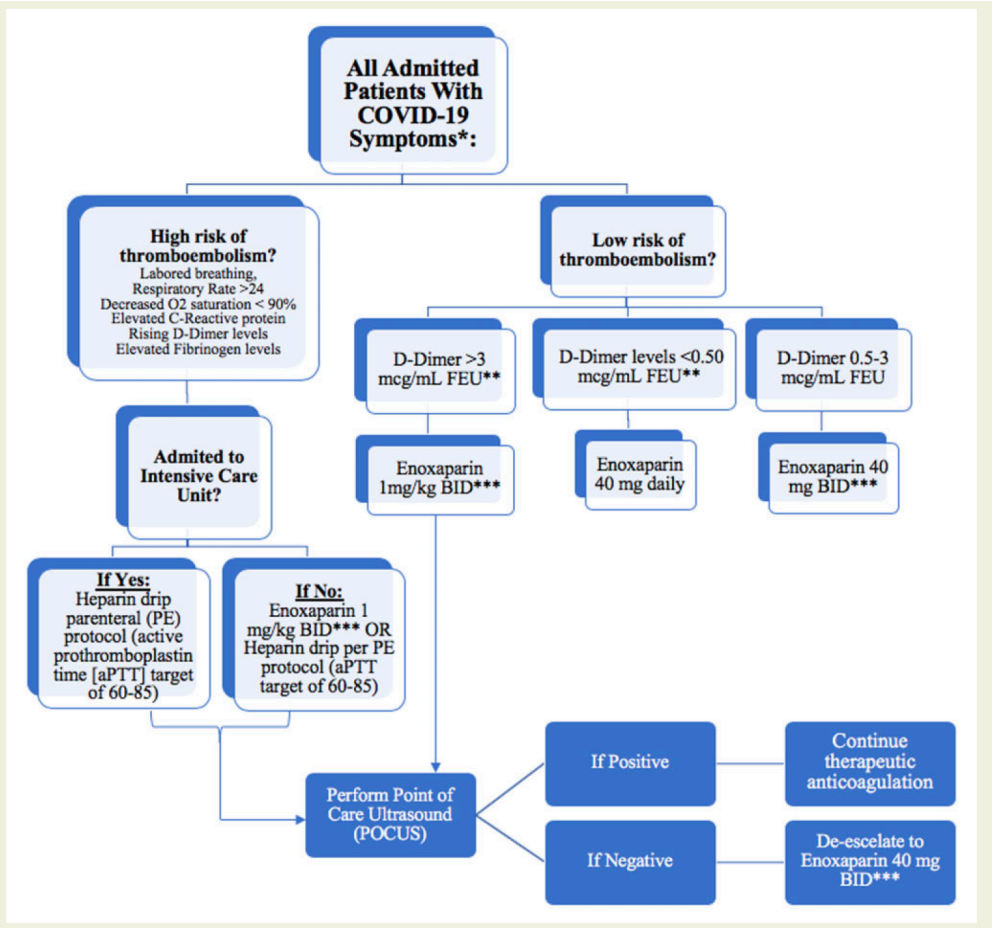

Figure 1 Tailored algorithm/protocol for the management of coagulopathy in COVID-19 patients. *High bleeding risk patients are excluded. Also exclude patients with platelet count <50 000; INR >2. **FEU, fibrinogen equivalent unit. ***Adjust enoxaparin dose for renal failure.

COVID-19
すべての入院患者

血栓症ハイリスク？
Labored breathing
呼吸数＞24回/分
酸素化低下SpO2＜90%
CRP上昇
Dダイマー上昇
フィブリノゲン上昇

ICU入院？

YES
ヘパリン投与
（肺塞栓プロトコル）
APTTターゲット
60~85秒

NO
エノキサパリン
1mg/kg　2回/日
or
ヘパリン投与
（肺塞栓プロトコル）
APTTターゲット60~85秒

血栓症ローリスク？

Dダイマー
＞3μg/ml
エノキサパリン
1mg/kg 2回/日

Dダイマー
＜0.5μg/ml
エノキサパリン
40mg/kg

Dダイマー
0.5～3μg/ml
エノキサパリン
40mg 2回/日

POCUS

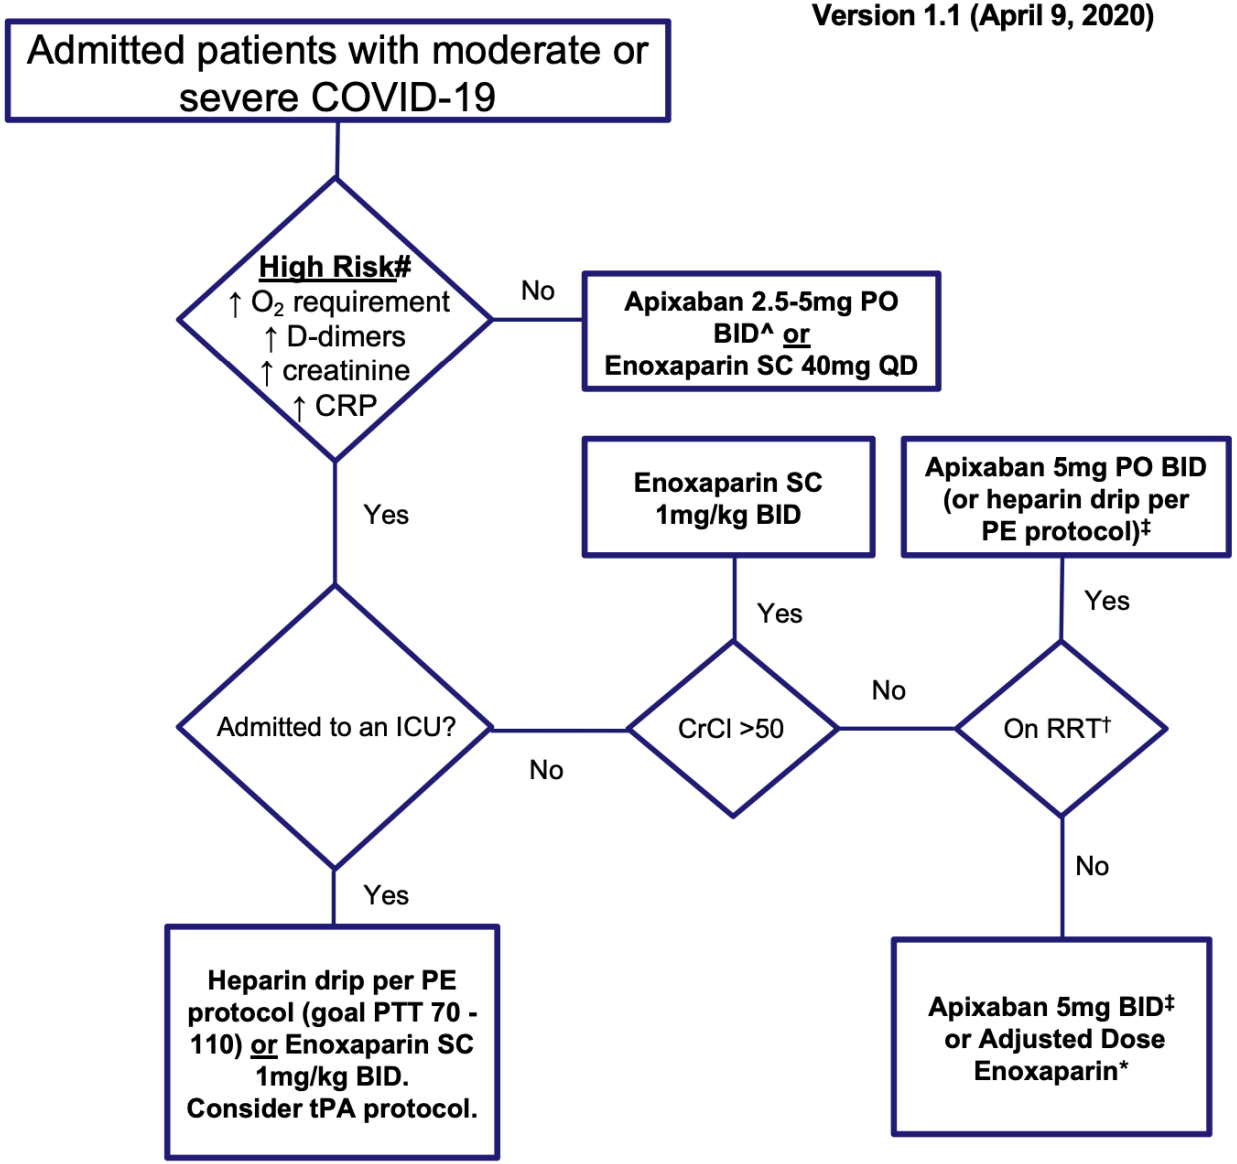
陽性
抗凝固治療
継続

陰性
エノキサパリン
40mg 1日2回
にDe-escalate

出血High Riskは除外
血小板＜5万、INR＞2は除外
エノキサパリンは腎機能により調節が必要

Mount Sinai COVID-19 Anticoagulation Algorithm

Version 1.1 (April 9, 2020)



Inclusion: All admitted patients with moderate or severe COVID-19
Exclusion: High risk of bleeding as judged by treating physician

Obtain at baseline and daily:
- CBC, PT/PTT, D-dimer

Hold anticoagulation if:
- Platelet count <50,000; INR>1.5
- Evidence of current or recent bleeding

If patients take AC at home:
- May switch to therapeutic enoxaparin or heparin (as per algorithm) for the duration of hospitalization, unless contraindicated

Rivaroxaban may be used in place of Apixaban at any indication

Discharged COVID-19 patient on therapeutic anticoagulation while hospitalized

Consider Prophylactic AC for 2 weeks post discharge (Apixaban 5mg PO BID for 2 wks)

#High Risk: No precise metrics exist. Consider exam (eg O_2 sat<90%, RR >24), ↑O_2 requirement (eg, ≥4L NC), labs (eg, ↑d-dimers, C-reactive protein)
^Efficacy and dose not established; prophylactic or treatment doses acceptable

†RRT – Renal Replacement Therapy
‡ If ≥80 years of age or weight ≤60 kg, reduce apixaban to 2.5 mg BID
* If CrCl <30: enoxaparin 0.5mg/kg BID with anti-Xa level after 3rd dose

Mount Sinai COVID-19 Anticoagulation Algorithm

Definition of high risk for progression to ICU

- There is insufficient evidence to precisely define “high-risk” or provide specific cut-off values for individual factors
- Clinicians should consider a combination of exam findings (e.g, labored breathing, RR >24, decreased O_2 sat<90%), increased O_2 requirement (eg, ≥4L NC), and lab biomarkers (eg, elevated CRP, elevated creatinine, rising d-dimer >1.0).

Rationale for early anticoagulation

- Pathophysiology of COVID-19 associated respiratory disease is consistent with pulmonary vascular thromboemboli with increased dead space ventilation
- Autopsy studies have demonstrated venous thromboembolism in deceased coronavirus patients[1]
- Early anticoagulation is necessary to prevent propagation of microthrombi at disease presentation
- Anticoagulation may be associated with decreased mortality[2]

Rationale for choice of anticoagulant

- Heparins bind tightly to COVID-19 spike proteins[3,4]
- Heparins also downregulate IL-6 and directly dampen immune activation[5]
- DOACs do not appear to have these anti-inflammatory properties
- Rivaroxaban can be used in place of Apixaban in this algorithm

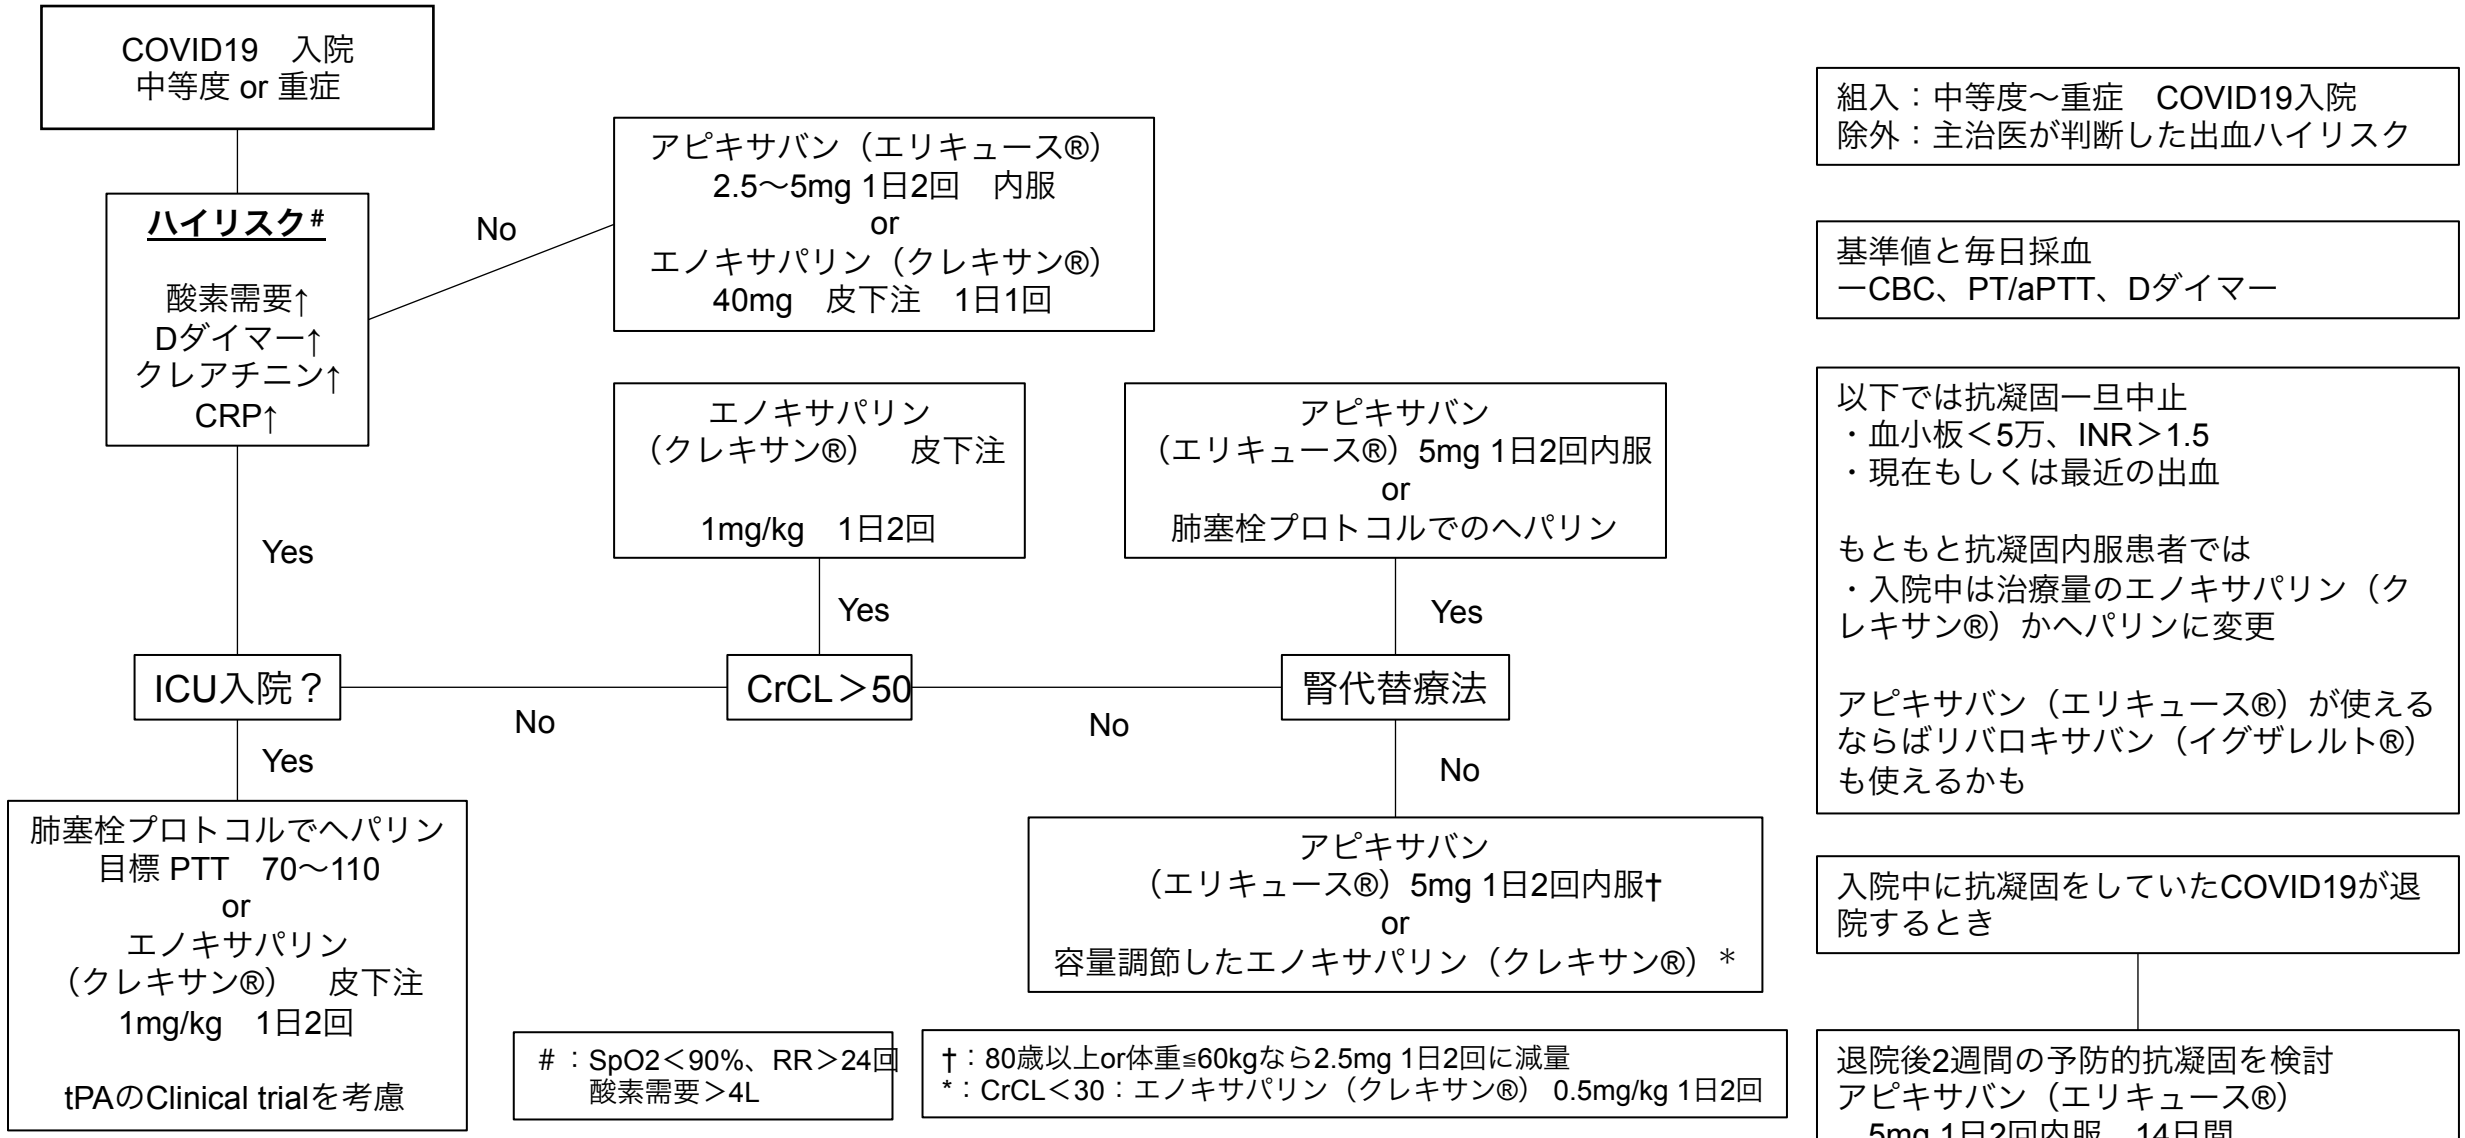
Version 1.1 (April 9, 2020)

Mount Sinai COVID-19　抗凝固アルゴリズム



組入：中等度〜重症　COVID19入院
除外：主治医が判断した出血ハイリスク

基準値と毎日採血
ーCBC、PT/aPTT、Dダイマー

以下では抗凝固一旦中止
・血小板＜5万、INR＞1.5
・現在もしくは最近の出血

もともと抗凝固内服患者では
・入院中は治療量のエノキサパリン（クレキサン®）かヘパリンに変更

アピキサバン（エリキュース®）が使えるならばリバロキサバン（イグザレルト®）も使えるかも

入院中に抗凝固をしていたCOVID19が退院するとき

退院後2週間の予防的抗凝固を検討
アピキサバン（エリキュース®）
5mg 1日2回内服　14日間

エノキサパリン（クレキサン®）1mg＝100IU

Mount Sinai COVID-19　抗凝固アルゴリズム

ICUへの進行リスクの高さの定義

- 高リスクを正確に定義したり、個々の要因に具体的なカットオフ値を提示するためのエビデンスは不十分

- 検査所見（ex.呼吸困難、RR>24、O2減少<90％）、O2必要量増加（ex. ≥4L NC）、および検査所見（ex.CRP上昇、クレアチニン上昇、Dダイマー上昇>1.0）の組み合わせを考慮する必要あり

早期抗凝固療法の根拠

- COVID-19に関連する呼吸器疾患の病態生理は死腔換気の増加を伴う肺血管血栓塞栓と一致

- 剖検研究では、死亡したコロナウイルス患者の静脈血栓塞栓症が証明されている

- 疾患発現時の微小血栓の増殖を防ぐためには早期の抗凝固療法が必要である

- 抗凝固療法は死亡率の低下と関連している可能性がある

抗凝固剤選択の根拠

- ヘパリンはCOVID-19スパイク蛋白質に強固に結合する

- ヘパリンはまた、IL-6を減少させ、免疫活性化を直接減衰させる

- DOACはこのような抗炎症作用を持っていないよう

- このアルゴリズムではアピキサバンの代わりにリバロキサバンを使用することができる。

Coagulation abnormalities and thrombosis in patients with COVID-19

THE LANCET
Haematology

Panel: **Management of coagulopathy in patients with severe COVID-19**

Diagnostic approach

- Repeated (every 2–3 days) assessment of:
  - D-dimer
  - Prothrombin time
  - Platelet counts

Therapeutic management

- Subcutaneous low molecular weight heparin for all patients hospitalised
- Consider venous thromboembolism in patients with rapid respiratory deterioration and high D-dimer concentrations
  - Do CT angiography or ultrasound of the venous system of the lower extremities
  - If diagnostic testing is not possible and there are no bleeding risk factors, consider therapeutic anticoagulation
- Other interventions (such as plasma exchange, or administration of other anticoagulants or anti-inflammatory drugs) are experimental and should be considered in a clinical trial setting only

診断アプローチ

以下を繰り返し（2〜3日に1回）評価

- Dダイマー
- プロトロンビン時間
- 血小板数

治療管理

- 低分子ヘパリンの皮下注射（入院患者の全例）
- 急速な呼吸状態の悪化とDダイマーの上昇があれば静脈血栓を検討
- 静脈のCT血管造影や下肢静脈の超音波検査を行う
- 診断テストができない場合や出血の危険因子がな場合抗凝固治療を検討
- その他の介入（血漿交換など。他の抗凝固剤や抗炎症剤の投与）は実験的なものであり臨床試験のみを考慮

今後の展望

- 現在計画されている臨床試験

Take home message

- COVID-19の患者は**血栓イベントのHigh Risk**であり、かつ

  ミクロな肺の毛細血管血栓症が、呼吸不全の病態生理の一つかもしれない

- 状態の変化があれば**血栓塞栓イベントを閾値低く**考えるべき

- その効果についてはRCTの結果を待つ必要があるが、

  重症COVID-19の場合は、出血リスクが高くなければ

  治療量としての抗凝固を行ってもいいのかもしれない
